NEXA V3.28 — MASTER FEATURE SPECIFICATION

Complete feature inventory and master-app build record

Current master version: V3.28.0 — Realtime Voice / Master Build

NEXA combines personal finance, shared money groups, Zeeza social communication, Dream Marketplace commerce, vendor operations, staff management, AI utilities and notification routing.

AI / Utility Layer

AI chat; price checking; comparison; image-based scam checking; transcription; spoken AI responses; controlled master-app navigation.

AI Tool Layer — V3.24

Authenticated read-only tools for profile, money summary, Dream Marketplace orders and vendor summary. Tool requests are allowlisted and limited per AI turn. Live results are supplied before personal-data answers; missing values must not be invented.

Confirmed AI Actions — V3.25

Consequential actions are prepared first and require explicit user confirmation. Implemented actions: cancel Dream Marketplace order, settle debt, send friend request, unfriend and block user. Pending actions are short-lived, authenticated-user-bound, consumed once, and revalidated at execution.

AI Marketplace — V3.26

Natural-language shopping and comparison remain powered by the application-controlled shopping specialist. Matching Dream Marketplace listings are surfaced directly in the NEXA AI conversation with product, price and seller information when available. Users can hand off to the Dream Marketplace screen from the AI result. AI does not perform checkout or purchase execution in V3.26.

Notifications — V3.27

The native application shell registers authenticated Expo push tokens with the NEXA backend, requests notification permission, configures the Android notification channel, listens for notification taps while the app is active/backgrounded, and handles a notification that launches the app from a cold start. Known payloads route into Money, Zeeza, Chat, Dream Marketplace or Vendor Staff.

Realtime Voice — V3.28

NEXA now has a native WebRTC speech-to-speech path using the OpenAI Realtime API. The trusted NEXA server mints short-lived client credentials; the protected OpenAI project key never ships to the mobile app. The mobile client establishes a WebRTC session, sends microphone audio, receives generated speech, and surfaces realtime transcript events in the NEXA AI conversation. The previous recorded transcription → chat → speech pipeline remains available as fallback. Realtime voice is instructed not to execute consequential actions directly; application confirmation remains the control point.

Master App

Home, Money, Zeeza, Dream Marketplace and Profile; Money mounts Groups; Zeeza mounts Friends and Chat; Marketplace preserves /api/mall/*; Vendor Staff master route.

Build Workflow

One master project ZIP is maintained. The master feature specification stays embedded and is updated with meaningful build milestones. Testing is deferred; future corrections are made directly in the same master project.

Roadmap

V3.24 AI Tool Layer — completed; V3.25 Confirmed AI Actions — completed; V3.26 AI Marketplace — completed; V3.27 Notifications — completed; V3.28 Realtime Voice — completed; V3.29 Production Hardening; V3.30 Release Candidate.

Version History

V3.17 Zeeza; V3.18 Dream Marketplace branding; V3.19 master shell; V3.22 AI Core/voice; V3.24 AI Tool Layer and single-master workflow; V3.25 Confirmed AI Actions; V3.26 AI Marketplace result surfacing; V3.27 native notification registration and tap/deep-link routing; V3.28 native WebRTC Realtime voice path.
