NEXA V3.29.0

Master Feature Specification — Production Hardening

Build checkpoint

V3.29.0 advances the active NEXA master from V3.28.0 (Realtime Voice) into the Production Hardening milestone. Existing app features remain in the same master project.

Implemented baseline safeguards

- Security response headers: nosniff, frame denial, no-referrer, restrictive Permissions-Policy and no-store caching.
- Request correlation: accepts a constrained incoming X-Request-Id or creates a UUID; returns it in the response.
- Liveness endpoint: GET /health/live indicates that the server process is responding.
- Readiness endpoint: GET /health/ready checks database query readiness and returns 503 if unavailable.
- Configurable CORS allowlist through CORS_ORIGINS (comma-separated). An empty value retains permissive development behavior; production deployments should configure explicit trusted origins.
- Graceful shutdown: SIGTERM/SIGINT stop accepting new HTTP connections, close the database when supported, and include a bounded shutdown timeout.
- Central fallback error handler logs a correlation ID and returns a generic 500 response without a stack trace.

Operational notes

This milestone is a baseline hardening pass, not a security certification. Testing, deployment-specific CORS configuration, load testing, dependency review, payment-provider verification, and full regression remain for V3.30 Release Candidate. The project workflow continues to defer formal testing until requested.

Roadmap

V3.29 — Production Hardening (current) • V3.30 — Release Candidate (next)
